Topic	How to use EduCloud/Netlab	Networking basics	Database Fundamentals	SQL	Backend (Phyton + Flask)	Ethical Hacking	Cybercesurity
What i already learn	How to run GNS3	What it is: MAC - Individual device numer like a fingerprint but to communicate only in local net IP - a device's address on a network (local or global), used so data knows where to send it. DNS - It converts the domain name which we understand into an IP address which computers understand Port - It's adress (number) that helps sort data to correct application/services (most common are HTTP - 80, HTTPS - 443, SSH - 22, FTP - 21) TCP - protocol responsible for transport of data very safe because take care about delivering all data UDP - also protocol responsible for transport of data, faster that TCP but can loose some data in transport TLS - way of encrypting data HTTP - rules how date will be transfer	Database is a system to storage, ogranize and menage data, data can be storage Row based, Column based or in Tabels. Tables contains columns and rows, records are numerate with Primary Key that identify it in their own table and Foregin Key that identify record in other tabel, thanks of that database can create relationship between them what helps avoid repiting same data. DBMS is software used to create, manage and interact with databases. And to communicate with Database Managment System (DBMS) we use SQL language				
	Not started	☐	☐	☐	☐	☒	☒
	Heard of it, don't understand it yet	☒	☐	☐	☒	☐	☐
	I understand it	☐	☒	☐	☐	☐	☐
	I can explain it in my own words	☐	☒	☐	☐	☐	☐
	I've actually used/tested it myself	☐	☐	☐	☐	☐	☐
